

1.What is DAM and why we use it?

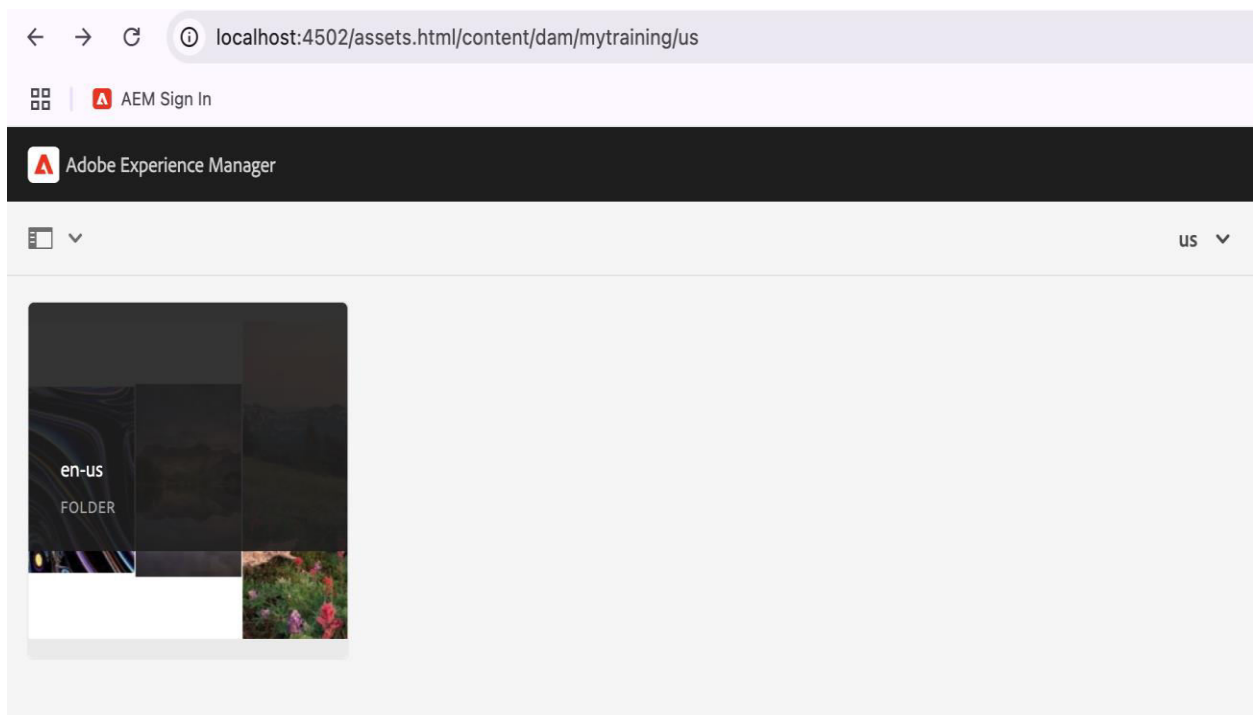

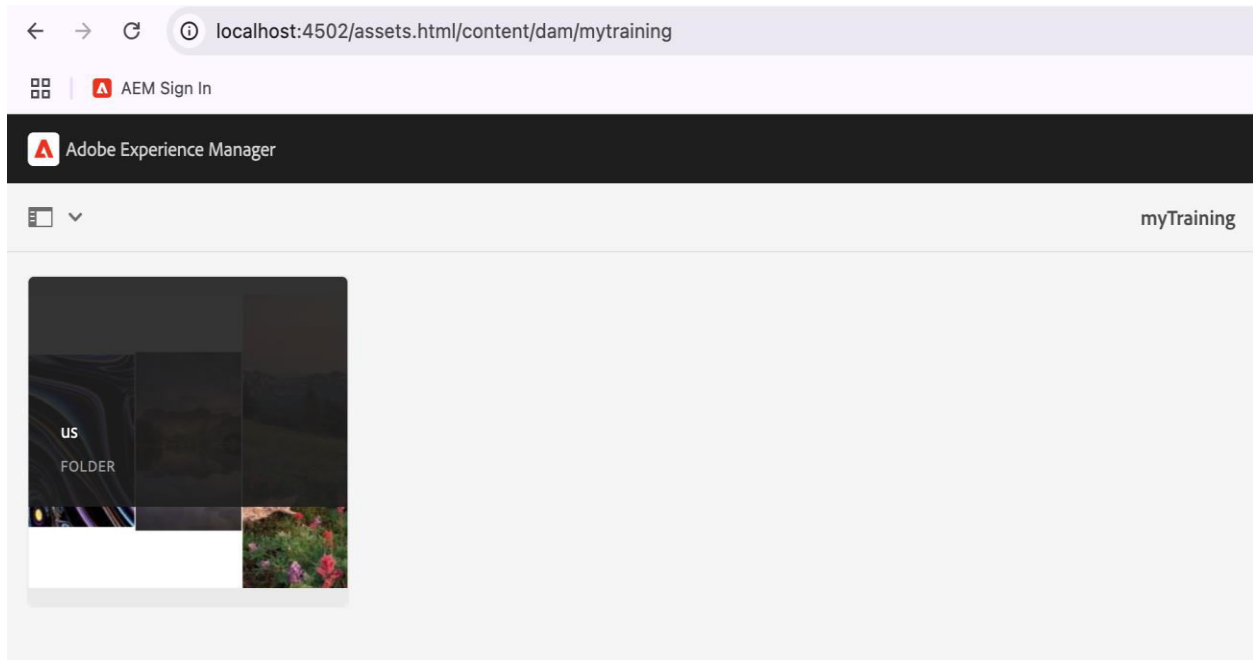

DAM (Digital Asset Management) in AEM is a system for storing, managing, and delivering digital assets like images, videos, documents, and more.

Why use DAM?

- **Centralized Storage:** Organizes all digital assets in a structured repository.
- **Metadata Management:** Allows tagging, descriptions, and categorization of assets for easy retrieval.
- **Renditions:** Automatically generates different sizes/formats of an image.
- **Version Control:** Tracks changes and previous versions of assets.
- **Integration with AEM:** Assets can be easily used in components/pages.

2>Create one folder inside our project folder and follow the path:
“/content/dam/myTraining/us/en-us” and upload 2 images and author those images on page using image component as we s as we see today.

3. What is renditions? Check the renditions for 2 images which we had uploaded

Renditions in AEM are different variations of an image automatically generated when an asset is uploaded to DAM. They help optimize images for different devices and screen sizes.

4. Add two fields in hello world component with name FirstName and Last Name and print the values on hello world.html component using properties

5. Give try using @ValueMapValue annotation on HelloWorldModel sling java model “com.myTraining.core.models.HelloWorldModel”

```
1 > //.../  
16 package com.myTraining.core.models;  
17  
18 > import ...  
35  
36 @Model(adaptables = Resource.class) 3 usages  
37 public class HelloWorldModel {  
38  
39     @ValueMapValue 1 usage  
40     private String firstName;  
41  
42     @ValueMapValue 1 usage  
43     private String lastName;  
44  
45     public String getFirstName() { no usages  
46         return firstName;  
47     }  
48  
49     public String getLastName() { no usages  
50         return lastName;  
51     }  
52 }  
53
```

6. Why we are using package manager

AEM Package Manager is used for:

- **Deploying content & code** across different environments.
- **Creating backups** of components, configurations, and assets.
- **Easier migration** of assets between AEM instances.
